THE GOAL: CREATE AN ALL NEW VSM FAMILY WITH BEST-IN-CLASS PERFORMANCE AND USABILITY

The culmination of nearly 4 years of development, the 8600 Series VSM represents a new era in magnetometer measurement for today’s researcher.

Leveraging the combined expertise of Lake Shore Cryotronics and Princeton Measurement Corporation (PMC), which Lake Shore acquired in 2013, our team of scientists and engineers approached development with one goal in mind: creating the most advanced electromagnet-based VSM capable of characterizing a broad range of materials with unprecedented ease and precision.
MORE SCIENCE, LESS TIME

ADVANCED MEASUREMENT PERFORMANCE
The 8600 Series VSM raises the bar for magnetometer performance and convenience. These VSMs combine high sensitivity (15 nemu), rapid measurement speed (10 ms/pt), and simple operation for more accurate measurements, faster.

CONVENIENT OPERATION
The entire 8600 Series system has been reimagined with a focus on clean, ergonomic design that simplifies the researcher’s interaction with the system. A motorized head brings the sample to a comfortable height for easy, one-handed exchange of the QuickLIGN™ sample rods. Temperature options include a cryostat, high-temperature oven, and single stage variable temperature insert. The combined temperature range of the options is 4.2 K to 1273 K. All three GlideLOCK™ options quickly slide into place and are auto-detected, with the software automatically displaying controls for the specific option. The magnet poles are also easily adjusted with the ExactGAP™ indexed positioning system that allows the pole gap to be set at one of six repeatable positions, eliminating the need to recalibrate after each change.

DESIGNED FOR FORC
The 8600 Series VSM was created with first order reversal curve (FORC) measurement as a primary objective. FORC analysis is greatly enhanced by the high sensitivity of the 8600 Series VSM. FORC also benefits from increased data point density, and the new VSM flies through complex FORC data collection sequences in a fraction of the time required on previous systems.

FLEXIBLE AND ADAPTABLE
The system’s software simplifies control of the VSM. Standard predefined measurement routines are combined with configurable field and measurement loops to provide a flexible data acquisition environment. In addition, the software features an integrated scripting tool, which enables the user to extend the existing routines with an open-ended software scripting language that can be used to perform customized measurement protocols and interface with third-party lab equipment.
THE APPROACH: RETHINK EVERYTHING

As part of the project charter, the team had no constraints. Our approach was to design a completely new system for the ultimate in performance and usability.

We developed novel measurement techniques and reimagined each part of the system—from the mechanics of loading a sample to the fluidity of the all new software interface—to create a next generation VSM capable of quickly characterizing the magnetic properties of a broad range of materials, especially very low moment samples.

FOCUSED ON LEADING-EDGE RESEARCH

The 8600 Series VSM enables better measurements in less time, accelerating magnetics research and supporting the study of novel, low moment, and hybrid materials.

PERFORMANCE

Resulting from extensive design innovations that lower the noise floor and increase sampling speed, the 8600 VSM system brings new levels of measurement performance to magnetic characterization. The system features ultra-high sensitivity (down to 15 nemu), wide dynamic range, faster field ramping (10,000 Oe/s) and rapid data acquisition (up to 10 ms/pt). A complete -2 T to +2 T hysteresis loop with 3,000 measurement points can be completed in about 30 seconds.

Field setting resolution of 1 mOe is available across the entire measurement range, and especially helpful in regions where moment gradient ΔM is high. This fine resolution, combined with high sensitivity and fast measurement speed, make the 8600 Series ideal for first order reversal curve (FORC) measurements, which inherently involve very large data sets.

Lake Shore’s significant background in FORC guided the 8600 Series development, which set out to ensure that FORC measurements were fully supported and convenient to make. The resulting new VSM system not only performs these complex measurement routines with great speed and precision, but also provides built-in tools to ensure that configuring and managing FORC profiles is very straightforward.

USABILITY

Convenience is a primary focus of the 8600 Series, starting with the QuickLIGN™ sample rod exchange, which can be accomplished easily with one hand. When variable temperature studies are needed via cryostat, oven, or wide-range SSVT, the 8600 Series VSM has significantly streamlined the process of adjusting the pole gap and installing and configuring the temperature option. Overall time required is reduced to well under 5 minutes, with the system software auto-detecting the type of temperature option and reconfiguring settings instantly.

While the 8600 Series software provides a broad range of measurement flexibility, Lake Shore knows that researchers are often interested in trying new measurement protocols. The software incorporates a full scripting engine and encourages users to either edit and adapt the standard protocol scripts provided, or create their own.

The powerful combination of measurement sensitivity, speed, integrated FORC routines, convenience, and adaptability make the 8600 Series VSM an ideal platform for advanced magnetics research.
**MEASUREMENT APPLICATIONS**

The need to characterize new and emerging materials continues to push the limits of electromagnet-based VSM systems. The 8600 Series VSM steps up to meet the most demanding material research applications.

Extremely fast data acquisition cycles make the system ideal for research environments where rapid measurement results can accelerate the discovery of important new properties. QuickLIGN™ sample holders are offered for thin film, liquid, powder, and bulk samples, making the VSM an excellent choice for busy labs with varying sample measurement needs.

The high sensitivity of the 8600 Series VSM particularly benefits research into low moment materials such as ultra-thin magnetic films and multilayers, nanoscale magnetic materials, dilute magnetic semiconductors, and paleomagnets.

The system benefits applications involving the study of:

- Natural magnets (rocks, sediments, etc.)
- Nanoscale wires, particles, nano-crystalline alloys, etc.
- Magnetic semiconductors
- Ferrofluids
- Magnetic thin films and multi-layers
- Ferrites and permanent magnets, including rare-earth materials
- Magnetocaloric effect materials

**IDEAL FOR THE BROADEST RANGE OF MAGNETIC MATERIAL CHARACTERIZATION APPLICATIONS**

![VSM Applications Diagram]
**Very Easy Sample Exchange** — motorized head movement for sample extraction, allows for one-handed exchange of the QuickLIGN™ sample rods

**Easy-to-Install Temperature Options** — software automatically identifies and displays option-specific controls for installed GlideLOCK™ temperature options to quickly measure from 4.2 K to 1,273 K

**Wide Variety of Sample Holders** — accommodate thin film, bulk, liquid, and powder samples

**Unattended Single-Stage Control** — automatic switching between cryogenic to heated operations

**Repeatable Gap Settings** — six indexed ExactGAP™ magnet positions each have their own saved calibration

**Two Electromagnet Configurations** — choose from the 4 in or 7 in magnets for field requirements up to 3.26 T

**Standard Autorotation** — continuous z-axis sample rotation, any angle
ALL NEW SOFTWARE — set up, execute routines and experiments with ease using sample measurement flow screens

ADVANCED SCRIPTING CAPABILITIES — customize your experiments with your own routines and integrations

INTEGRATED FORC MEASUREMENT — simple setup and rapid execution of complex FORC measurements

ERGONOMIC WORKSTATION WITH 17 IN MONITOR — in addition to housing all of the integrated electronics, the workstation acts as a convenient tabletop and has a drawer to store sample holders and samples

CONTROL ELECTRONICS — sensitive electromagnet-based VSM, featuring a noise floor as low as 15 nemu and moment stability of 0.05% per day

SENSITIVE, LOW NOISE FLOOR ELECTROMAGNET-BASED VSM SYSTEM FOR THE MOST DEMANDING MEASUREMENTS
ALL NEW SOFTWARE

EASILY EXECUTE MEASUREMENT ROUTINES AND EXPERIMENTS

The 8600 Series comprehensive Windows®-based software simplifies the process of acquiring data. The flexible software allows the user to monitor the real-time performance of the VSM and to construct measurement sequences from a set of predefined controls. The menu-driven graphical user interface (GUI) provides the ability to control field and temperature to a specific setpoint or to loop these parameters through a range of settings with a specified step value. Predefined measurement controls are also provided to complete individual moment readings, hysteresis loops and even collect first order reversal curve (FORC) data. The sequences can be saved and recalled for repeated measurements.

The interface also simplifies the implementation of the three GlideLOCK™ temperature options (86-OVEN, 86-CRYO, and 86-SSVT) by automatically detecting and displaying each option as it is plugged into the system. With the integrated Model 705 gas controller, the software can provide automated, unattended VSM measurements throughout the entire temperature range (4.2 K to 1273 K).

Advanced data processing capabilities of the software include expand and offset data, correct for demagnetization and slope factors, normalize for sample mass and volume, subtract substrate corrections and backgrounds from measurement data, calculate and display derivative curves, and much more.

In addition to measuring magnetization curves and magnetization vs. time or temperature, the 8600 Series VSM provides insight for a host of measurements including:
- Hysteresis loop
- Isothermal remnant magnetization
- DC demagnetization remanence
- Minor loops
- FORC
- \( M(T) \) — temperature dependent magnetization
- \( M(\Theta) \) — rotational hysteresis and anisotropy
CUSTOM SCRIPTING
For customized experiments, the 8600 Series VSM offers advanced scripting capabilities through an integrated interface easily accessible from the data acquisition tab in the software. Scripting is extremely useful for implementing customized VSM functionality that may not have been implemented in the standard software release. High level system calls are exposed so that the user can easily control the VSM data collection process and interweave external process calls. The script window enables you to capture the predefined measurements to view as a script. This is useful for understanding exactly how the 8600 is executing the measurements, but also provides an easy way to create a starting template for customized measurements. This powerful addition to the software puts the researcher fully in control of their unique measurement process.

CUSTOMIZE
PRECONFIGURED SCRIPTS
OR CREATE YOUR OWN
MEASUREMENT SPEED IS KEY

While there have been many features included to make setup and data collection easy, the most notable feature in the 8600 Series VSM is the data acquisition speed. A complete change in the acquisition architecture permits an unprecedented data rate with exceptional, built-in noise suppression. The 8600 Series is capable of continuous 10 ms/point acquisition (100 points per second). A complete -2 T to +2 T hysteresis loop with 3,000 measurement points can be completed in less than 30 seconds.

OPTIMIZED FOR FORC DATA ACQUISITION

First order reversal curves (FORCs) provide information regarding magnetic interactions and coercivity distributions which cannot be obtained from measurements of a materials hysteresis loop alone. FORC measurements can be helpful in studying materials such as:

- FORC has long been the standard measurement and analysis protocol used by earth and planetary scientists studying the magnetic properties of natural samples because FORC can distinguish between single-domain (SD), multi-domain (MD), and pseudo single-domain (PSD) behavior and because it can distinguish between different magnetic mineral species.
- FORC is relevant to any material composed of fine (micron- or nano-scale) magnetic particles, which includes a broad array of magnetic materials (e.g., permanent magnets, recording media, magnetic nanowires and dots).
- The complex magnetic signatures of multi-phase magnets is difficult, if not impossible, to unravel from a hysteresis loop measurement alone. FORC can distinguish between phases in magnetic materials containing more than one phase (e.g., exchange spring magnets, soft shell/hard core nanowires).

A FORC is measured by saturating a sample in a field $H_{sat}$, decreasing the field to a reversal field $H_a$, then sweeping the field back to $H_{sat}$ in a series of regular field steps. This process is repeated for many values of $H_a$, yielding a series of FORCs that can be exported for further analysis.

Because FORCs may contain many thousands of data points, measurement speed is critical to productive research. However, data point quantity alone is not enough. FORC requires adherence to specific data collection protocols in order for the subsequent analysis to be meaningful.

The 8600 Series VSM has been specifically designed to execute FORC measurements quickly and easily, and with high precision. 10,000-point FORCs can be completed in minutes.

Proven FORC data acquisition protocols are built into the standard 8600 VSM system software and are very easy to set up, run, and modify. FORC data sets, once acquired, are readily exported for analysis using FORCinel® or similar third-party tools to render distribution plots of interaction and switching fields. In addition, the system includes Real-Time FORC (RTForc™) software, which enables fully automated FORC data acquisition using the 8600 Series software.

FORCs are indispensable in characterizing interactions and coercivity distributions that reveal insight into the relative proportions of reversible and irreversible components of the magnetization in many technologically important magnetic materials. The 8600 Series VSM is the best VSM in the industry for convenient, productive, and accurate FORC measurement.

REPEATABLE AND CONVENIENT

EASY SAMPLE ROD EXCHANGE AND SAMPLE ROTATION
The 8600 Series VSM’s motorized head brings the sample to a comfortable height for easy exchange of sample rods. The QuickLIGN™ quick-release coupling mechanism allows the rod to slide smoothly into the measurement collar and lock securely in place — simple enough to do with one hand.

The autorotation feature offers full software-based control over sample rotation about the z-axis. The sample can be continuously rotated in either direction.

RAPID TEMPERATURE OPTION CHANGE
8600 Series GlideLOCK™ variable temperature options include a low-temperature LHe/LN₂ cryostat, a high-temperature oven, and single stage variable temperature (SSVT) insert. All three quickly click into place and are auto-detected, the software automatically displaying controls for the specific option.

ExactGAP™ repeatable pole gap indexing minimizes delays when an option change is required. Use preset gap settings for each temperature option or sample holder to quickly move the caps to a precise, precalibrated position, and do so repeatedly without having to manually recalibrate for each setting.

QUICKLIGN™
SAMPLE INSTALLATION

GLIDELOCK™
OPTION ALIGNMENT

EXACTGAP™
MAGNET INDEXING
Choose from 6 repeatable gap widths by unbolting the top plate and clicking the selector into place.

Electromagnet and sample holder options
The 8600 Series VSM offers two models based on variable-gap 4-inch or 7-inch electromagnets, both of which offer a stability of 0.05%/day. The ExactGAP™ pole gap indexing makes it fast and easy to reconfigure the magnet gap for the required sample or option size. A variety of sample holders accommodate thin films, solids, powders, liquids, and bulk materials.

ExactGAP™ magnet indexing
Choose from 6 repeatable gap widths by unbolting the top plate and clicking the selector into place.

These features work together to provide the most precise positioning possible.

AUTOMATED WIDE TEMPERATURE OPERATION
When using the temperature options, the 8600 Series VSM supports fully automated unattended variable temperature operation across the full temperature range of each option spanning 4.2 K to 1273 K. The Model 705 gas controller automates the gas handling and manages the exhaust gas to prevent unsafe venting of extreme temperature gases and icing of exhaust port when venting cryogenic gases.
GLIDELOCK™ TEMPERATURE OPTION ALIGNMENT

The GlideLOCK™ alignment system was created to simplify the insertion and removal of all three temperature options into 8600 VSM providing rapid, repeatable sample positioning in all configurations.

1. Slide the GlideLOCK mounting tray out from the magnet.

2. Place the temperature option onto the GlideLOCK tray and engage the alignment pin.

3. Slide the tray back in to the magnet to precisely engage the temperature option.

#### Moment Measurement

- **Noise floor (emu RMS)**
  - Room temperature:
    - 0.1 s/pt: 150 nemu
    - 1 s/pt: 60 nemu
    - 10 s/pt: 15 nemu
    - With oven or cryostat option:
      - 10 s/pt: 300 nemu
    - With SSVT option:
      - 10 s/pt: 90 nemu
    - With vector coil option: x coils: 90 nemu at Exact GAP 3; y coils: 200 nemu at ExactGAP 3
  - Dynamic range: 25 x 10^4 to 10^7 emu
  - Moment stability: Better than ±0.05% of full scale/day for fixed coil geometry at constant field and temperature
  - Reproducibility: Better than ±0.5% or ±0.1% of full scale, fixed rotation angle and range, with sample replacement
  - Moment accuracy: Better than 1% of reading ±0.2% of full scale with a geometrically identical test sample and calibrant
  - Sample mass: 0 g to 10 g

#### Field Measurement

- **Field accuracy**: 1% of reading or ±0.05% of full scale
- **Field resolution**: 1 mOe
- **Field ramp rate**: 8604: 10,000 Oe/s
  - 8607: 10,000 Oe/s (in high-speed mode; reduced when in high field mode)
- **Closed loop field control stability**: 1 mOe

#### Sample Rotation

- **Setting resolution**: 0.1°
- **Setting reproducibility**: <1°
- **Rotation range**: Continuous

#### Certifications

- **CE**: Yes
- **Application of Council directives**:
  - 2014/35/EU Low Voltage Directive
  - 2014/30/EU EMC Directive
  - 2011/65/EU RoHS Directive
- **Standard to which conformity is declared**:
  - EN61010-1: 2010 Overvoltage Category II, Pollution Degree 2;
  - EN61326-1: 2013 Class A, Controlled EM Environment;
  - EN55011: 2009 Class A, Controlled EM Environment;
  - EN50581: 2012

#### Utilities

- **Total system cooling water power dissipation (50 or 60 Hz)** — see list of available recirculating chillers
  - 8604: 4250 W
  - 8607: 13400 W

EXPAND YOUR CAPABILITIES WITH OPTIONS

TEMPERATURE OPTION OPERATING RANGES

86-SSVT SINGLE STAGE VARIABLE TEMPERATURE OPTION WITH GlideLOCK™ ALIGNMENT SYSTEM

The single stage variable temperature assembly allows you to take measurements from 100 K to 950 K using LN₂, nitrogen, and argon gas. A single point measurement can be taken at 77 K. The fully automated 705 gas controller permits the user unattended operation from high to low temperatures, eliminating the need to remove or resaddle your sample. This ensures accurate measurements throughout the full operating range. Rapid cool down from 950 K to room temperature and from room temperature to 100 K provides efficiency and high throughput. Like our full suite of variable temperature options, the single stage variable temperature option uses the GlideLOCK alignment system to simplify option insertion and produce repeatable sample positioning and ensuring optimum noise floor.

Designed to deliver superior thermal performance, the unit’s vacuum insulation prevents freeze over at low temperatures and can operate safely at high temperatures without the risk of damaging neighboring components.

Included with the 86-SSVT:
1. Single stage variable temperature insert with GlideLOCK mount
2. 25 L LN₂ Dewar with condenser stand
3. LN₂ transfer line with condenser assembly
4. Instrument cables
5. Sample rods and holders
6. Wall mount bracket to store option when not in use

Supplemental 86-SSVT equipment requirements:
1. Lake Shore 86-VTA variable temperature option kit
2. Lake Shore 705 gas controller
3. Argon gas cylinder with 344 kPa (50 psi) gas regulator and 3 mm hose barb (can also be a ¼ NPT female fitting)
4. Nitrogen gas cylinder with a 344 kPa (50 psi) gas regulator and 3 mm hose barb (can also be a ¼ NPT female fitting)
5. LN₂ source to fill the provided Dewar
6. Clean compressed air (276 kPa [40 psi])
7. Lake Shore TPS-FRG compact turbo pumping system (required for full automation) or mechanical vacuum pump (E2M or equivalent) kit providing sample space blank off pressure of <0.67 Pa (5 × 10⁻³ Torr) for routine operation
8. Turbomolecular vacuum pump (Lake Shore TPS-FRG or equivalent) kit for cryogen transfer line maintenance — can also be used in place of the E2M rotary vacuum pump
9. A Pirani or thermocouple vacuum gauge capable of measuring pressures from 0.1 to 100 Pa (10⁻³ to 1 Torr)
86-OVEN High Temperature Oven with GlideLOCK™ Alignment System

The high temperature oven is used to investigate materials at high temperature. It is an electrically heated outer tube assembly with thermal insulation for sample-zone temperatures from 100 °C to 1000 °C (373 K to 1273 K). Temperatures from 30 °C to 1000 °C (303 K to 1273 K) are also possible, however, below 100 °C (373 K) measurement time increases. Argon gas inside the sample chamber enhances heat flow with the sample. The 705 gas controller can be added as an option to automatically stop the argon feed after the measurement is completed, but the 705 is not required for the 86-OVEN option.

The sample zone chamber is lined with a heat-resistant and intrinsically non-magnetic material. The provided sample holder is a quartz tube sample rod attached to a boron-nitride sample cup. The 86-OVEN uses the GlideLOCK alignment system to simplify insertion and produce repeatable sample positioning and optimum noise floor.

To accommodate the oven within the magnet, ExactGAP index 5 is required. A mechanical vacuum pump capable of maintaining inlet pressures down to 0.67 Pa (5 × 10⁻³ Torr) must be supplied by the user.

The efficient thermal insulation consists of an evacuation outer chamber with multiple reflective heat shields. Sample zone temperatures as high as 1000 °C are attained with a power consumption of approximately 70 W. Two results of the low power consumption are minimal magnetic interference and increased temperature uniformity in the sample zone. The oven is particularly well suited to measuring Curie temperatures of ferromagnetic or ferrimagnetic materials at temperatures up to 1000 °C. The sensitivity of the VSM permits Curie temperature determinations at relatively low field intensities, allowing more inherently accurate determinations.

At room temperature and above, measurements may be performed in an argon atmosphere to protect the sample from oxidation.

Included with the 86-OVEN:
1. Oven assembly with mount
2. Nickel Curie sample cylinder
3. Instrument cables and related accessories
4. Sample rods and holders

Supplemental 86-OVEN equipment requirements:
1. Lake Shore 86-VTA temperature option kit
2. A mechanical vacuum pump (Lake Shore E2M or similar) capable of achieving a pressure below 0.67 Pa (5 × 10⁻³ Torr) and a speed of 1 m³/h, along with a KF-16 flange pump inlet
3. Access to turbomolecular vacuum pump (Lake Shore TPS-FRG or similar) capable of doing better than 1.33 × 10⁻⁶ Pa (10⁻⁹ Torr) for annual evacuation of transfer line vacuum space
4. LHe or LN₂ storage Dewar (Lake Shore 1220-50 or similar) with top down fitting to accept the 12.8 mm (0.5 in) diameter transfer line — the transfer line furnished with the 86-CRYO cryostat is particularly well adapted for use with 25 to 60 L storage vessels, and can be readily adapted to other capacity storage vessels (in most cases, a LHe Dewar will be provided by your local liquid gas distributor when LHe is delivered)
5. Gas cylinder with 1 to 5 psi pressure regulator to deliver clean, dry helium or nitrogen gas (depending on liquid cryogen)
The autotuning cryogenic temperature controller is used to measure and control our full suite of variable temperature options. The 86-VTA includes a Lake Shore temperature controller, thermocouple input card (when purchased for use with the high temperature oven or single stage variable temperature assembly), GlideLOCK alignment system mount, vacuum handling kit, mounting hardware, flanges, hoses, connectors, and accessories. Note: only one 86-VTA is required for all variable temperature options.

**86-VTA TEMPERATURE OPTION KIT**

**TPS-FRG TURBOMOLECULAR VACUUM PUMP STATION**

Used to annually evacuate the cryogen transfer line of the optional cryostat and single stage variable temperature assembly (transfer line and kit are included with these options), the TPS-FRG provides vacuum to $1.33 \times 10^{-3}$ Pa ($10^{-6}$ Torr). In addition to annual cryogen transfer line maintenance, the turbomolecular vacuum pump can also be used in place of the E2M rotary vacuum pump for evacuating the cryostat vacuum space.

**705 GAS CONTROLLER**

The 705 gas controller was specifically designed to automate the gas handling for the temperature options. The 705 operation is controlled by the 8600 Series software and allows the user to have unattended operation from 4.2 K to 1,273 K. In addition, when used in conjunction with the TPS-FRG turbomolecular pump, the 8600 system also monitors the vacuum space surrounding each temperature option to ensure insulation.

**RECIRCULATING CHILLERS**

Lake Shore offers NesLab® recirculating chillers in order to provide a complete laboratory solution. The NesLab chillers feature a CFC-free refrigeration system.

The refrigeration system uses a hermetically sealed compressor and hot gas bypass system of temperature control. This system eliminates on/off cycling and premature wear of the compressor. Strong pumps provide continuous flow even through cooling lines with small IDs.

**86-VEC**

The vector option extends the VSM measurement capabilities to facilitate investigations of anisotropic magnetic materials, allowing you to determine their vector magnetization components and susceptibility tensor. When used in combination with autorotation, the vector coils provide information that is essentially identical to that provided by a dedicated torque magnetometer. The vector coils mount directly to the 86-VTA option for use with all temperature options or can be mounted to the 86-VEC-MOUNT (sold separately) for room temperature measurements.

**86-VEC-MOUNT**

The vector option mount is used to mount the vector coils in the magnetic gap when room temperature measurements are desired. For measurements in conjunction with a temperature option, the vector coils mount directly to the 86-VTA.

**86-VEC attached to SSVT option**

**86-VEC attached to 86-VEC-MOUNT for room temperature operation**
**Site Requirements**

A system-specific site prep checklist will be provided.

**Power**

Instrumentation, computer, and optional vacuum pump require two standard single-phase electrical outlets (20 A maximum). Magnet power supply and optional recirculation chiller require 3-phase electrical outlets (21 A maximum).

**Water**

Electromagnet requires one supply and one return line for cooling with up to 15 L/min and 30 to 50 psi. Magnet power supply requires a minimum of 7.6 L/min with a maximum pressure of 80 psi and +15 °C to +30 °C water temperature.

**Floor**

The floor must support the weight of the magnet, supply, and the equipment used to move them into place. The weight of the console is negligible in comparison. Heavy concrete ground floors usually prove best, not only because they have the required strength, but such a floor also transmits minimal building vibration to the magnetometer. The system also requires minimum spacing between each of the above three pieces and 0.75 m for access to the rear of the equipment. (See Installation Dimensions and Weight table.)

**Environment**

The VSM requires a temperature-controlled environment that is relatively free of airborne dust and debris. There should be no equipment placed next to the VSM system that would emit or be susceptible to high levels of magnetic interference (distribution boxes, vibration equipment, x-ray machines, etc.)

---

ORDERING INFORMATION

8600 Series systems

8604  Advanced performance VSM with 4 in electromagnet, Gen2 head, Model 737 controller, system console, Model 643 power supply, and software

8607  Advanced performance VSM with 7 in electromagnet, Gen2 head, Model 737 controller, system console, Model 648 power supply, and software

VSM-TRAINING  2 days on-site VSM operational training/verification—price includes travel time and expenses; *1 additional operational training/verification day required for each and every temperature option

VSM-TRAINING-1  Additional VSM operational training/verification days

7400 Series upgrades

Consult Lake Shore for information on upgrading your 7400 Series VSM to the 8600 Series

Options

Options are only compatible with the 8600 Series VSMs.

86-CRYO  8600 Series LN₂/LHe cryostat option. Temperature operating range is LN₂ operation 77 K (flooded), 55 K to 450 K control range. Used with the GlideLOCK alignment system. Includes wall mount storage bracket. Requires 86-VTA and TPS-FRG turbomolecular pump (must be ordered separately). Supplemental requirements are LN₂ Dewar (1220-50 or equivalent) or LHe Dewar and LN₂ or LHe gas cylinder and regulator.

86-oven  8600 Series high temperature oven option. Temperature operating range is room temperature to 1273 K. Used with the GlideLOCK alignment system. Includes wall mount storage bracket. Requires 86-VTA and 705 gas controller (must be ordered separately). Supplemental equipment requirements are argon gas cylinder with regulator, and vacuum pump with blankoff pressure of 5 x 10⁻³ Torr.

86-SSVT  8600 Series single stage variable temperature option. Temperature operating range is 77 K (flooded), 100 K to 950 K control range. Used with the GlideLOCK alignment system. Includes wall mount storage bracket. Requires 86-VTA, 705 gas controller, and a mechanical vacuum pump (E2M or equivalent) kit providing sample space blank off pressure of 5 x 10⁻³ Torr. Periodic access to a turbomolecular vacuum pump (Lake Shore TPS-FRG or equivalent) for annual evacuation of the transfer line is required (if available, turbomolecular pump can also be used for routine operation). Supplemental equipment requirements are argon gas cylinder with 50 psi gas regulator, nitrogen gas cylinder with 50 psi gas regulator, an LN₂ source to fill the provided 25 L LN₂ Dewar, and clean compressed air (40 psi).

86-VTA  8600 Series variable temperature control option with Model 336. Option kit contains temperature controller and thermocouple card, GlideLOCK option mount, flanges, hoses, connectors, and accessories.

705  The Model 705 gas controller automates the 86-SSVT and 86-OVEN gas handling operation. The 705 operation is controlled by the 8600 Series software and allows the user to have unattended operation on the 86-SSVT option from 100 K to 950 K and optimizes the gas handling functions in conjunction with the 86-OVEN option.

86-VEC  Vector coil option. Mounts directly to the 86-VTA option for use with all temperature options or can be mounted to the 86-VEC-MOUNT (sold separately) for room temperature measurements.

86-VEC-MOUNT  Vector option mount for room temperature measurements.

8600 Series accessories

730907  2.4 mm diameter test sample sphere, NIST-traceable, 3.47 emu

730908  Nominal 3 mm diameter test sample, 99% pure nickel sphere—6.92 emu—standard with all 8600 Series systems (for daily VSM use)

730909  Nominal 1 mm diameter test sample, 99% pure nickel—0.25 emu—standard with all 8600 Series systems (cross-calibrated to the 730908)

86-0910  Cement, high temperature, -200 °C to 843 °C

730931  Sample holder, 2-piece cup, Kel-F®, upper and lower portion, required sample access is 8 mm (ExactGAP™ index 2)

730933  Sample holder, thin film side mount, Kel-F®, required sample access is 8 mm (ExactGAP™ index 2)

730934  Sample holder, thin film bottom mount, Kel-F®, required sample access is 8 mm (ExactGAP™ index 2)

730935  Sample holder, liquid, upper and bottom portion, Kel-F®, required sample access is 8 mm (ExactGAP™ index 2)

730937  Sample holder, 2-piece cup, boron nitride, required sample access is 8 mm (ExactGAP™ index 2)

730938  Sample holder, thin film side mount, boron nitride, required sample access is 8 mm (ExactGAP™ index 2)

730939  Sample holder, thin film bottom mount, boron nitride, required sample access is 8 mm (ExactGAP™ index 2)

86-SH-0840  Sample holder, gel cap straw mount (room temperature only), required sample access is 8 mm (ExactGAP™ index 2)

86-SH-0841  Sample holder, disposable gel cap with straw, 1000 quantity (room temperature only), required sample access is 8 mm (ExactGAP™ index 2)

86-IS-0930  Sample rod, quartz with integrated thin film bottom mount, required sample access is 8 mm (ExactGAP™ index 2)

86-IS-0931  Sample rod, quartz with integrated thin film side mount, required sample access is 8 mm (ExactGAP™ index 2)

86-SR-0932  Sample rod, quartz rod only—requires separate sample holder, required sample access is 8 mm (ExactGAP™ index 2)

86-IS-0933  Sample rod, fiberglass with integrated thin film side mount, required sample access is 3.5 mm (ExactGAP™ index 1)

86-IS-0934  Sample rod, fiberglass with integrated thin film bottom mount, required sample access is 3.5 mm (ExactGAP™ index 1)

86-SR-0935  Sample rod, fiberglass rod only—requires separate sample holder, required sample access is 8 mm (ExactGAP™ index 2)

86-IS-0937  Sample rod, quartz with integrated thin film side mount, required sample access is 3.5 mm (ExactGAP™ index 1)

86-IS-0938  Sample rod, quartz with integrated thin film bottom mount, required sample access is 3.5 mm (ExactGAP™ index 1)

86-LC  Replacement set of large gap pick-up coils (one set is included with each system)

86-0911  Replacement Hall probe

TPS-FRG-100/120V  Compact turbo pumping system; includes V-84 turbo pump (NW 40) with oil free dry scroll backing pump, FRG-700 full range gauge, controller, and interface cable to USB port; includes Agilent 24 month warranty NOTE: requires SYS-TP-KIT

TPS-FRG-220/240V-CE  Compact turbo pumping system; includes V-84 turbo pump (NW 40) with oil free dry scroll backing pump, FRG-700 full range gauge, controller, and interface cable to USB port; includes Agilent 24 month warranty NOTE: requires SYS-TP-KIT

SYS-TP-KIT  Includes all components necessary to connect NW 40 turbo pumping system to the vacuum port of any Lake Shore system (except probe stations)

1220-50  50 L LN₂ Dewar with ½ in top withdraw port and 10 psi pressure relief valve

Go to www.lakeshore.com for the current list of available recirculating chillers
